ENGR 343  Science, Religion and the Limits of Knowledge

REQUIRED TEXT

RECOMMENDED READING

COURSE OBJECTIVES AND SCOPE

There is a widespread belief among scientists and engineers that science and religion are essentially unrelated areas of human inquiry. According to this outlook (which is sometimes referred to as the ‘doctrine of non-overlapping magisteria’), science ought to limit itself to factual questions about nature, and religion should deal with issues related to meaning and value. As long as this distinction is observed, there is no apparent reason why the two disciplines should not coexist peacefully.

Although this approach provides a sensible compromise, there seems to be something rather artificial in such a strict separation. Indeed, since religion represents a global view of the world, it must necessarily make claims that concern nature and our place in it. As such, it is bound to address a variety of issues that are of interest to science (evolution and the creation of the universe come to mind immediately). If we are, therefore, inclined to be realistic (as scientists and engineers ought to be), we should assume that there is a certain amount of overlap between theology and science, and consider the consequences.

The main purpose of this course is to examine a number of key theological claims, and evaluate whether they have a rational justification from a scientific perspective. In thinking about what the term “rational” means in this context, it is useful to recognize that our actions and opinions are guided by what physicist (and historian of science) Gerald Holton describes as a “robust, map-like constellation of … beliefs about how the
world as a whole operates.” He refers to this overall outlook that shapes our attitudes as a Weltbild (which is a somewhat broader German word for “world view”).

Although the Weltbild of any given individual depends to a large extent on his or her social, ethnic and educational background, it is fair to say that it always contains a subset of beliefs that pertain to the natural world. It is perhaps here that we might locate an appropriate meaning for the attribute “rational,” at least when it comes to scientifically minded individuals. It is reasonable to assume that for such a person, a coherent world view would be one that satisfies the following two conditions:

1) The set of “core” beliefs about the natural world must be compatible with existing scientific knowledge.

2) The “non-scientific” core beliefs should be consistent (at least in some measure) with the scientific ones.

In applying these criteria, it is important to keep in mind that the term “consistent” must be used somewhat loosely. Indeed, I seriously doubt that the entire mindset of any individual could pass a strict test of logical soundness (which is perhaps what makes us human in the first place). With that in mind, one could argue that the rationality of our Weltbild can be justified by establishing appropriate “logical bridges” between the disparate clusters of views that constitute it. Formal reasoning is of little use in this enterprise, and should ultimately give way to analogies and metaphors.

What is it about analogies and metaphors that makes them so suitable for this purpose? The primary motive for focusing on these two modes of description stems from the fact that they have always been a natural tool for explaining difficult concepts, both in science and in theology. If these two disciplines are seen as manifestations of the same overarching reality (as Christian theology suggests), then it is perfectly reasonable to assume that analogies can also help bridge the apparent gap that separates them. From a theological perspective, what we are really proposing here amounts to adding a certain number of “scientific” metaphors to the already existing traditional ones. The potential value of such metaphors has been recognized by several contemporary thinkers:

“Metaphors ‘fund’ theology, providing the language and images out of which theological concepts grow; they describe the unknown in terms of the known. … When metaphors lose their original meaning and fruitfulness, the theology built upon them must be reconstructed, drawing upon new metaphors appropriate for a new age… It seems reasonable that physics, as well as biology and the other sciences which infuse our culture, can be a source of religious metaphors.” Robert J. Russell

In order to draw the appropriate analogies, it will be necessary to consider a number of scientific theories in some detail. Our primary focus will be on nonlinear systems and chaos theory, which will be the subject of the four technical projects. We will also discuss metamathematics, quantum mechanics, relativity and string theory, but in a way that is much less formal. As you learn more about these topics, you will gain insights into some of the most perplexing phenomena that modern science has discovered. It is important to keep in mind, however, that acquiring this kind of knowledge is not the
primary objective of this class. It is more appropriate to think of it as a “tool” that will help you get a better understanding of some of the theological and philosophical issues that will be raised. Recognizing that the subtle workings of nature are often strange and thoroughly counterintuitive is, of course, interesting in its own right, but it ought to excite a sense of wonder that goes well beyond mere scientific curiosity. It is my hope that you will experience this feeling, and that you will continue to pursue this line of inquiry long after your formal education is completed.

LEARNING OUTCOMES

Students who successfully complete this course should be able to:

1. Grasp the philosophical and theological implications of chaos theory, in the context of phenomena such as intermittency and hypersensitivity to initial conditions.
2. Understand the interplay between chance and lawful behavior in complex systems, particularly as it pertains to the emergence of novel forms of organization in nature.
3. Understand the epistemological limitations of scientific explanations, and relate this knowledge to the theological method of inquiry.
4. Reflect on their own views about religion and relate them to their scientific training.

All four outcomes will be assessed through the final essay.

HOW THE COURSE IS ORGANIZED

The topics covered in this course are grouped into four modules:

**Module 1**  The Limits of Scientific Knowledge (Lectures 1 – 3)
**Module 2**  Fundamental Theological Questions (Lectures 4 – 5)
**Module 3**  Controversial Issues: Miracles, Evolution and Religious Pluralism (Lectures 6 – 8)
**Module 4**  The True, the Good and the Beautiful (Lectures 9 – 10)

The lectures and the associated readings are described below.

**Module 1. The Limits of Scientific Knowledge**

Week 1  Faith, reason and analogical thinking  
(Reading: Sections 1.1 and 1.2)
Week 2  Unknowable truths in science and mathematics
        (Reading: Section 9.1)

Week 3  Unknowable truths in science and mathematics (continued)
        (Reading: Section 9.1)

**Module 2. Fundamental Theological Questions**

Week 4  The attributes of God
        (Reading: Sections 9.2 – 9.3)

Week 5  Goodness, Omnipotence and Omniscience
        (Reading: Section 9.4)

**Module 3. Controversial Issues: Miracles, Evolution and Religious Pluralism**

Week 6  Miracles
        (Reading: Section 10.1)

Week 7  Evolution
        (Reading: Section 10.3)

Week 8  Religious pluralism
        (Reading: Section 10.4)

**Module 4. The True, the Good and the Beautiful**

Week 9  Ethics, science and theology
        (Reading: Sections 8.1 – 8.3)

Week 10  Aesthetics, science and theology
        (Reading: Sections 7.1 – 7.3)

**GRADING**

Instead of a final exam, this course will have a 6 – 8 page final essay, which will be due on **Monday, March 16**. In the final essay, you will be asked to provide your views regarding the relationship between science and religion. You are expected to select one of the topics covered in class and expand on it. You may combine several topics or perhaps propose some of your own; however, all such modifications will be subject to approval by the instructor. The essay should include the theoretical background for your
discussion, as well as an explanation for your choice of topic (I would like to know why a
particular question is more interesting to you than some others).

The specific claims and opinions that you choose to express in the essay are entirely
up to you (bear in mind that agreeing with me won’t get you any extra points!). You will
be graded on the quality of your arguments and your understanding of the material
discussed in class. Writing skills such as clarity, grammar, and style do matter, and will
be a factor in my grading.
